

**Project:** Watermain Condition Assessment (VAU-003)

**Updated:** February 7, 2019

**Description:**

HydroVAC (non-disruptive digging) to expose water mains for assessment. The pipe condition will be recorded for prioritizing future replacements.

An assessment will be conducted using non-invasive technologies to investigate the condition of various metallic watermains under highway crossings, water courses (paths) and railways.

**Benefits to Community:**

Provides the City with vital information that will assist in updating internal GIS (electronic mapping) records of pipe material and state of pipe under railway/river/highway crossings.

This helps in determining whether money should be spent to repair, rehab or replace the metal pipe, or if its current state is sustainable.

*Severely Corroded Pipe*

*Pipe in Good Condition*
